Module 5 Graded Quiz

Quiz, 13 questions

13/13 points (100.00%)

Congratulations! You passed!

Next Item

1/1 point

1. What is the **order** of the following transfer function?

$$G(s) = \frac{s - 10}{s^2 + 2s + 1}$$

- This is the first order transfer function
- This is the second order transfer function

Correct

Correct! This transfer function contains a first order numerator and a second order denominator. The order of the function is the highest exponent in the transfer function, so that this is the second order transfer function.

- This is the third order transfer function
- This is the fifth order transfer function
- None of the above

1/1 point

2. What are the **poles and zeros** of the following transfer function?

$$G(s) = \frac{s^2 + 3s - 10}{s^2 - s - 12}$$

- The poles are -3 and 4; the zeros are 2 and -5

Correct

Correct! The zeros of a system are the roots of the numerator, and the poles of a system are the roots of its denominator.

- The poles are -4 and 3; the zeros are 5 and -2
- The poles are 2 and -5; the zeros are -3 and 4
- The poles are 5 and -2; the zeros are -4 and 3
- None of the above

1/1 point

3. What might be your action as a system control engineer if you need to **increase the overshoot** of a control loop system? (Select all that apply)

- Increase K_D

Un-selected is correct

- Decrease K_I

Un-selected is correct

☐ Decrease K_D

Un-selected is correct

☑ Increase K_P

Correct
Correct! Increasing partial gain leads to an increase of the overshot.

☑ Increase K_I

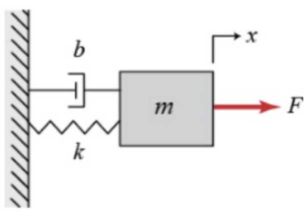
Correct
Correct! Increasing integral gain leads to an increase of the overshot.

☐ Decrease K_P

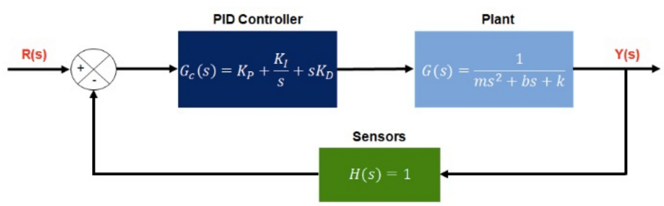
Un-selected is correct

✔ 1 / 1 point

4. Recall the Mass-Spring-Damper System example form the video on PID Control. This system is shown in the figure below.



As a system control engineer, you constructed the following closed loop transfer function to represent the Mass-Spring-Damper System. What is the **correct transfer function** for this closed loop?



○ Transformation function 1

$$G(s) = \frac{K_D s^2 + sK_P + K_I}{K_P + \frac{K_I}{s} + K_D s}$$

○ Transformation function 2

$$G(s) = \frac{K_P + \frac{K_I}{s} + K_D s}{K_D s^2 + sK_P + K_I}$$

○ Transformation function 3

$$ms^2 + bs + k + K_P + \frac{K_I}{s} + K_D s$$

$$G(s) = \frac{\quad}{K_P + \frac{K_I}{s} + K_D s}$$

- [x] Transformation function 4

$$G(s) = \frac{K_D s^2 + sK_P + K_I}{ms^3 + (b + K_D)s^2 + (k + K_P)s + K_I}$$

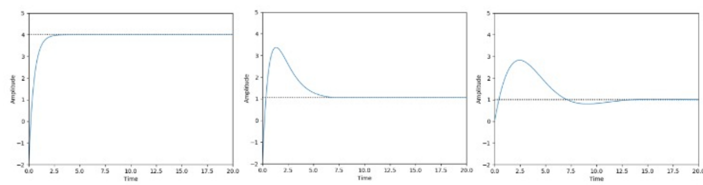
Correct
Correct!

- [ ] None of the above

---

1 / 1 point

5. You are given the step response of a few different PID controllers using the same gains for the same first order transfer function. **Determine a possible set of controllers** that generated these step responses:



Full Size Image.png

- [ ] 1st response by PI; 2nd response by PD; 3rd response by PID
- [ ] 1st response by PD; 2nd response by PI; 3rd response by PID
- [ ] 1st response by PI; 2nd response by PID; 3rd response by PD
- [x] 1st response by PD; 2nd response by PID; 3rd response by PI

Correct
Correct! Adding derivative control improves the step response in terms of overshoot and settling time, but slows down the rise time. Adding the integral term instead maintains a short rise time, and is able to reduce oscillation and overshoot, leading to a fast settling time as well. Adding both derivative and integral control terms brings the advantages of both these approaches.

- [ ] None of the above

---

1 / 1 point

6. What is the output of a typical output of a Longitudinal control module? (Select all that apply)

- [ ] Reference velocity

Un-selected is correct

- [x] Throttle angle

Correct
Correct! A longitudinal control module takes a reference velocity as an input and outputs throttle angle and brake pedal position.

- [ ] Steering angle

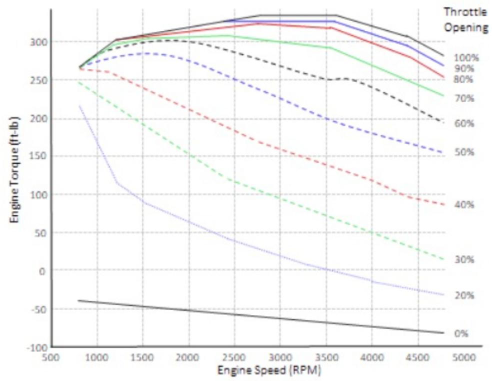
Un-selected is correct

Brake position

Correct
Correct! A longitudinal control module takes reverence velocity as an input and outputs throttle angle and brake pedal position.

✔ 1 / 1 point

7. Based on the engine map in the figure below, **determine the throttle angle** needed to produce 250 ft-lb of torque given that the current engine speed is 3500 RPM.

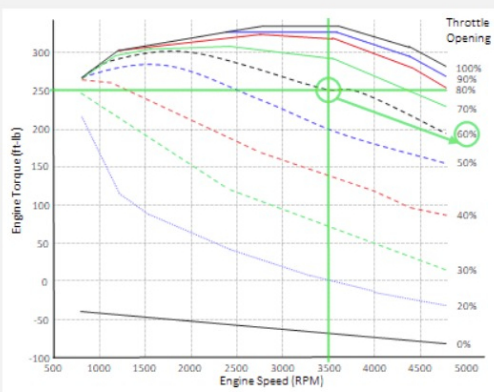


Full Size Image.png

If you need help formatting math functions, read this article.

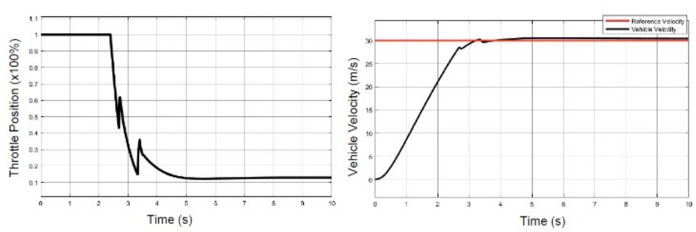
0.6

Correct Response
Correct!



✔ 1 / 1 point

8. The results of a simulation of the control response to a step change in desired speed of a dynamic vehicle model with a PID controller are shown in the figures below. There are two spikes on these figures: one spike is between 2 and 3 seconds, another spike is between 3 and 4 seconds. **What is the reason of these spikes?**



Full Size Image.png

Full Size image.png

- Engine-transmission torque loss
- Tire slip
- Nonlinear engine map

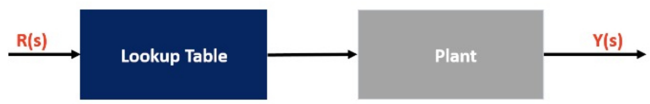
Correct
Correct! These artefacts are caused by the engine map nonlinearities.

- High level controller simplification: changing the integral to a summation over fixed length time steps in the Integral term
- None of the above

---

9. What type of **control system** is shown in the figure below?

1 / 1 point



- Feedback control
- Feedforward control

Correct
Correct! This diagram represents a feedforward controller. It show an open loop structure, where the reference signal is directly fed into the feedforward controller, which generates the inputs to the plant.

- Feedback-feedforward control
- None of the above

---

10. What types of inaccuracies are corrected by a feedback controller?

1 / 1 point

- Disturbances

Correct
Correct! The feedback controller corrects for errors that result from disturbances.

- Nonlinear engine map

Un-selected is correct

- Errors in the plant model

Correct
Correct! The feedback controller corrects for errors that result from inaccuracies in the plant model.

- High level controller simplification: changing the integral to a summation over fixed length time steps in the Integral term

Un-selected is correct

---

11. What assumptions are essential for creation of a **longitudinal feedforward input**?

(Select all that apply)

1 / 1 point

- [ ] The plant system is linear

Un-selected is correct

- [ ] The tire slip angle and ratio are negligible

Un-selected is correct

- [ ] Torque from the engine passes directly to the transmission without loss

Un-selected is correct

- [x] The vehicle is at steady state

Correct

Correct! Modelling feedforward block requires converting the entire longitudinal dynamics model into a fixed lookup table or reference map, that maps the reference velocity to the corresponding actuator signals assuming the vehicle is at steady state.

---

12. What are the sources of the load torque considered for a **longitudinal feedforward look-up table computation**? (Select all that apply)

1 / 1 point

- [x] Aerodynamic resistance

Correct

Correct! Aerodynamic resistance is a force acting opposite to the relative motion, so that it is a part of the load torque acting on the vehicle.

- [ ] Cornering force

Un-selected is correct

- [x] Rolling resistance

Correct

Correct! Rolling resistance is a force acting opposite to the relative motion, so that it is a part of the load torque acting on the vehicle.

- [ ] Sliding resistance

Un-selected is correct

- [ ] Static friction

Un-selected is correct

- [x] Gravitational resistance

Correct

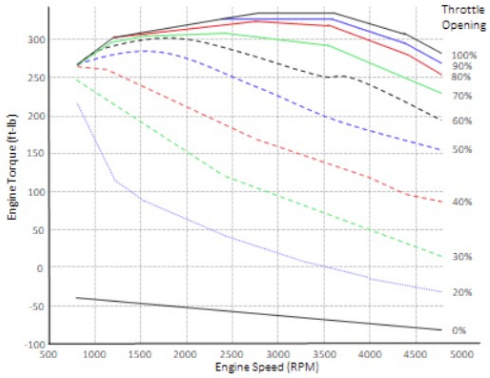
Correct! Gravitational resistance is a force acting opposite to the relative motion, so that it is a part of the load torque acting on the vehicle.

---

13. A vehicle is being operated on a highway with the reference velocity of 126 km/h (35 m/s) in gear 4 and it overcomes the total load torque of 300 ft-lb. This vehicle specification includes effective wheel radius of 0.35 m and 4th gear ratio of 2. **What throttle angle** is required for maintaining the the current speed of the vehicle?

1 / 1 point

Please use the below engine map for your computation.



Full Size Image.png

If you need help formatting math functions, [read this article](#).

0.7

Correct Response

Correct!

$\omega_w = \frac{V_ref}{r_eff} = \frac{35[m/s]}{0.35[m]} = 100[1/s] = 100[hertz]$

$\omega_e = \frac{\omega_w}{GR} = \frac{100[hertz]}{2} = 50[hertz]$

$\omega_e = 50[1/s] \cdot 60[s/min] = 3000RPM$

An intersection of $\omega_e = 3000[RPM]$ and $T_{engine} = 300$[ft-lb] falls on the green line on the chart, where the green line defines the throttle angle of 70%.
